

LEXPPOOF

AI finds the risk. LexProof proves what happened.

Verifiable contract operations for legal and procurement teams: AI review, enforced human approval, and a tamper-evident record anyone can check.

THE PROBLEM

AI contract review is fast. It leaves no proof.

Months later, an auditor, a regulator, a counterparty or a court asks:

01

Was this finding changed after the fact?

02

Who approved this redline, and were they allowed to?

03

Can you show it outside your vendor's own system?

Audit logs live inside the vendor's database. Everyone else has to take them on trust.

HOW IT WORKS

Every review becomes a record anyone can check

LexProof's servers produce the record. [They are not needed to check it.](#)

No wallets, tokens or crypto for users. The chain is an invisible public notary for 32-byte fingerprints.

FOUR GUARANTEES

What makes LexProof hard to copy

Proof of process

AI findings, the human decision, the published version and its fingerprint, sealed together and timestamped on chain.

Verify without trusting us

Your browser recomputes the fingerprint and reads the public chain directly. No login, no LexProof backend.

Enforced, audited approval

Nothing changes until a different person approves, admins included. Overrides need a written reason and are logged.

Privacy-preserving anchoring

Only 32-byte fingerprints go on chain. Never contract text, never personal data.

TRY IT NOW, NO LOGIN

Change one character. Watch the proof break.

Step 1 · Load the demo passport

VERIFIED

Root recomputed in your browser matches the root on Ethereum Sepolia.

Step 2 · Alter any component

ROOT MISMATCH

Change one word in the contract, policy, analysis or evidence and the roots no longer match.

Step 3 · Restore it

VERIFIED again

The original record checks out, with nothing to trust but math and the chain.

lexproofsolutions.com/public-verify/tamper · verdict in under a second

ONE CONTRACT, END TO END (ILLUSTRATIVE)

The liability cap that changed after approval

1 · AI flags

A supplier MSA caps liability below policy. LexProof flags the clause and proposes a redline.

2 · Approval

The proposer is blocked from approving. A second reviewer approves the fix.

3 · Sealed

The Legal Passport root is written to Ethereum. It can't be overwritten.

4 · Months later

Someone edits the approved cap in the stored record.

5 · Caught

Browser check: ROOT MISMATCH. CRE monitor: alert raised.

In the dispute, nobody has to trust anyone's database. **The original checks out against the chain; the edit doesn't.**

GOVERNANCE

Human approval that can't be skipped

- ✓ AI proposes redlines. Nothing in the contract changes until a person approves.
- 👤 Separation of duties: whoever proposed a change can't approve it. Admins included.
- 🔑 Break-glass override: admins only, with a written reason, recorded in the workflow history.
- 🔒 Every decision joins the evidence sealed in the Legal Passport.

WHAT THE PROPOSER SEES

Approve

Blocked: Separation of duties. You proposed this redline, so a different reviewer must approve or reject it.

Shown right beside the button, as in the live app.

Today enforced by the server and audited. Next: approvals signed with passkeys and sealed in the anchored record.

One evidence system, six ways to use it

Legal Passport

One page per contract: risk, findings, decisions, evidence and anchor. Exports as an evidence pack; verifies by QR.

Proof monitoring

A Chainlink CRE workflow re-checks stored evidence against the chain every 10 minutes and flags any mismatch.

Ask Lexi

Answers only from verified findings and cites the evidence. No support, no answer.

Counterparty portal

Counterparties review through a share link, no account needed.

Board Report

Portfolio KPIs, risk heatmap, top risks, and how much of it is provable on chain.

Scanned contracts

OCR for images and scanned PDFs, with personal data flagged on upload.

ARCHITECTURE

Inside the platform, and outside it

An independent proof monitor

- 1 **Cron trigger**, every 10 minutes
- 2 **Fetch** LexProof's public verify API under DON consensus
- 3 **Read** both Sepolia registries directly, finalized blocks
- 4 **Compare** and return a verdict per item, plus an alert flag

CRE CLI RUN · LIVE API · 3 OCT 2026

5 of 5 verified

3 evidence items · VERIFIED
2 passport roots · ROOT_VERIFIED
"alert": false

Tamper drill: one altered digit → ROOT_MISMATCH,
alert raised.

LexProof can't grade its own homework: the monitor checks LexProof's records against anchors LexProof can't rewrite.

WHO IT'S FOR

Where contracts meet audit

Procurement and S2P

Supplier contracts with provable approvals, ready when audit or a dispute comes.

Legal ops and GCs

Redlines approved under separation of duties, with a trail that holds up.

Audit and compliance

Evidence they can check themselves, with read-only access.

Moments that need proof: supplier disputes · regulatory audits · due diligence · renewals and re-negotiations

A trust layer beside SAP Ariba, Coupa and existing CLMs, not a replacement (integrations on the roadmap).

Built by a procurement practitioner: 25+ years in SAP Ariba and source-to-pay.

PRICING

Priced per workspace, not per seat

Plan	Price	Includes
Public Verify	Free, always	Anyone checks a Legal Passport in the browser, no login
Starter	\$149/mo (\$119 yearly)	3 users, 30 contracts a month, L2 anchoring, public verify links
Team	\$499/mo (\$399 yearly)	10 users, 150 contracts a month, approval workflows, RBAC, anchor monitoring
Enterprise	From \$1,500/mo	Unlimited users, 1,000+ contracts, SSO, custom playbooks, mainnet option, SLA

14-day free trial. Extra contracts \$2 (Starter) or \$1.50 (Team). Anchoring fees are built into the price, so customers never hold crypto. Typical CLM suites run \$25k–\$40k a year.

What reviewers ask first

Question	Answer
It's on a testnet?	Yes, Sepolia for the hackathon. Production anchors on mainnet or an L2 through a gas-sponsoring relayer.
Is this crypto?	No tokens and no wallets for users. The chain is a public timestamp for 32-byte fingerprints.
Does it prove the analysis is right?	No. It proves the record hasn't changed since it was sealed. LexProof is not legal advice.
Can't someone just edit the database?	They can try. Tamper-evident, not tamper-proof: any change breaks the root, and the chain copy can't be rewritten.
Is the monitor independent?	It checks LexProof's records against anchors LexProof can't rewrite. Proven in Chainlink CRE simulation; live deployment next.
Will it hold up as evidence?	It gives integrity evidence: a hash and public timestamp anyone can recompute, the kind used to authenticate electronic records (e.g. FRE 901(b)(9), 902(14)). Admissibility is for the court.

Live today, and what comes next

Now (live)

- AI review with OCR
- Enforced approval and separation of duties
- Legal Passport and evidence pack
- Browser verification and Tamper Test
- Proof monitor in CRE simulation

Next (pilots)

- Passkey-signed approvals
- Live CRE deployment with alerts
- Risk-tiered approval routing
- Standalone command-line verifier

Later (scale)

- Mainnet or L2 with a relayer
- SAP Ariba, Coupa and Workday integrations
- Independent evidence storage
- E-signature integration

THE ASK

Help us prove it on real contracts

- 1 Design partners: legal or procurement teams ready for a 90-day pilot on supplier contracts.
- 2 Feedback from auditors and GCs on what the evidence pack must contain.
- 3 Introductions to source-to-pay platform teams for integration.

APPENDIX

How to verify by hand

Passport root

```
root = SHA-256(sorted JSON of document_hash,  
policy_hash, analysis_hash, evidence_hash,  
algorithm "sha256")  
  
key = keccak256(passport_id)  
  
passportRoots(key) == root → VERIFIED
```

On Ethereum Sepolia
